

LaunchPad

The single source for AI ideation and use-case management.

LaunchPad runs the entire AI idea lifecycle in one place for everyone involved, not just the people who fund it. A submitter starts with the problem and turns it into a decision-ready use case, with a language model asking sharper questions as they go. Reviewers can see the entire pipeline and provide feedback in a tracked conversation. Leaders compare use cases side by side and decide what to fund.

Key Capabilities:

- Guided AI-assisted intake that turns rough ideas into decision-ready use cases
- AI coach that pressure-tests each idea and scores its readiness
- Configurable fields with built-in responsible-AI risk questions
- Reviewer pipeline with a request-info, edit-and-resubmit feedback loop
- Decision Center to compare candidates and decide what to fund
- Live status dashboard, plus PDF and work-tool exports

AI Assistant and Architecture

AI-powered vetting turns rough ideas into qualified, decision-ready use cases

How it Works

At each step, the AI assistant pushes back on the submitter's answers, pointing out gaps and questioning weak assumptions. Once the answers hold up, one click turns them into a clean, submission-ready summary.

Mission & Compliance Awareness

Vets ideas against federal constraints, FedRAMP, 508, and your agency's realities

Structured Output

Schema-validated responses keep summaries consistent and well-formatted

Inputs Preserved

Raw inputs preserved alongside AI-polished summaries

Architecture

Next.js 14 + TypeScript

App Router, React Context

Tailwind CSS + shadcn/ui

Custom-branded components

AI Integration Layer

Structured, validated responses from approved LLM

LLM Engine

Model agnostic. Adaptable to an approved endpoint

Flexible Deployment

Containerized for on-prem, Cloud.gov, or GovCloud

Guided Submission Workflow

A guided, plain-language workflow that turns raw AI ideas into decision-ready use cases

From Rough Idea to Business Case

LaunchPad walks every submitter through the idea one step at a time, forcing clarity on the problem, the users, the solution, its value, alignment, feasibility, and how success gets measured. The fields aren't fixed: admins turn nearly 50 of them on or off, so the form can run lean as a quick intake or deep as a full business case, depending on what your governance needs.

1	Submitter info (auto-filled)
2	Problem & target users
3	Solution, user, & business value
4	Governance, alignment, feasibility, & responsible AI
5	AI-drafted overview, readiness check, & submission

Define the Problem and Who It Affects

What problem or opportunity are you trying to address, and who's affected by it?

THE PROBLEM

What is the core problem or opportunity?

Trademark examining attorneys manually search for confusingly similar prior marks across word, design, and goods/services dimensions. Searches vary between attorneys, similar marks get missed, and that drives pendency and inconsistent likelihood-of-confusion refusals.

WHO'S AFFECTED

The people on the receiving end of the problem above.

How many users are impacted?

<10 10-50 50-500 500+

Refined Problem & Users Summary

AI-generated summary tying the problem to its affected users. Open Scout from the right panel to draft or refine.

AI-generated summary will appear here...

Next →

LaunchPad Scout

What is the most significant cost when similar marks are missed or search quality varies across attorneys?

USPTO's strategic goal of reliable IP rights delivery requires quantifying the operational or legal consequence of search inconsistency.

Applicants face surprise Office actions late in prosecution, increasing total pendency and rework (Recommended)

Post-registration conflicts rise, undermining the reliability of the trademark register

Examining attorneys spend extra hours defending inconsistent refusal decisions on appeal

Other (let me type my own)

I have enough, give me the scaffold

Pick an option above to continue.

Pipeline Dashboard

Real-time visibility into the idea pipeline, from draft through approval

The Whole Portfolio in One View

Reviewers and leaders see the whole portfolio in one place. Every idea moves through clear stages, from submitted to in review, needs info, approved, or rejected, and each one routes to the reviewer for its business unit. Filters narrow the board by unit or assignee, and a color-coded readiness mark shows which ideas are ready for a decision.

Decision Center

Compare use case submissions side by side and decide what to fund

How it Works

1. Select 2-4 candidates from the pipeline
2. Compare side-by-side, across every dimension
3. Get a recommendation with a verdict and a gap for each

Leadership gets a clear funding recommendation, with the full comparison behind it.

Compare 2 Use Cases for Funding Decision

Generate an AI briefing for the recommendation, then open the full comparison if you want the detail.

Executive Comparative Briefing

RECOMMENDATION

Fund first: Automated TEAS Submission Validator

Fund the TEAS validator first—it is ready, prevents errors at the source, and offers measurable pendency reduction with lower build risk.

Automated TEAS Submission Validator

Fund now

Pre-submission validator flags filing errors so applicants fix them upfront; directly reduces pendency and examiner rework.

Gap: Does not specify which error patterns will be covered or how the model will stay current with rule changes.

Specimen Acceptability Pre-Check

Fund with conditions

Image model flags likely-unacceptable specimens for examiner decision; improves consistency but needs training data and model sourcing confirmed.

Gap: No labeled training set identified and model sourcing is unconfirmed; cannot build without these resolved first.

HOW THEY DIFFER

One catches filing errors before applicants submit; the other flags specimen quality issues after filing for examiner review.

BIGGEST GAP ACROSS THE SET

Neither submission provides baseline error rates or specimen review times to verify projected ROI or measure success against.

Regenerate

Designed for Federal AI Governance

How LaunchPad is built to support the mandates agencies answer for

Federal requirement	How LaunchPad is designed to help
Annual public AI use-case inventory Advancing American AI Act OMB M-25-21	Acts as a live inventory for AI use cases. A single front door captures use cases as they arise and keeps them inventory-ready.
Minimum risk practices for high-impact AI OMB M-25-21	Captures impact level and risk at intake. High-impact cases are flagged for added review before they can advance.
CAIO oversight and documented decisions OMB M-25-21	Gives reviewers one board to record fund, conditions, or hold decisions with the reasoning attached.
AI Risk Management Framework NIST AI RMF 1.0 Govern and Map	Structures intake around the Govern and Map functions and builds a documented decision trail. Measure and Manage, the ongoing monitoring, sit in other systems.
Security authorization and accessibility NIST SP 800-53 Section 508	Designed to produce the risk documentation that supports an ATO. Section 508 accessibility is a design goal, not yet independently tested.

LaunchPad is a working prototype. These points describe how it is designed to support each requirement. They are not certifications and have not been independently validated or authorized in production.
